General features

Declared conditions of use

TCHVBZ units are packaged water-cooled water chillers with semi-hermetic screw compressors.
 TCHVIZ units are the chillers in soundproofed version.
 TCHVBZ and TCHVIZ units are available in version for operation as a heat pump by means of the inversion of the water circuit.

They are intended to be used in air conditioning systems that require a supply of chilled water (TCHVBZ-TCHVIZ) or hot water (TCHVBZ-TCHVIZ in the heat pump version with inversion of the water circuit).

The machine is designed for indoor installation.

The units conform to the following Directives:
 ○ Machine Directive 2006/42/EC;
 ○ Low voltage Directive 2006/95/EC (LVD);
 ○ Electromagnetic compatibility Directive 2004/108/EEC;
 ○ Pressure equipment Directive 97/23/C EEE (PED).

Guide to reading the code

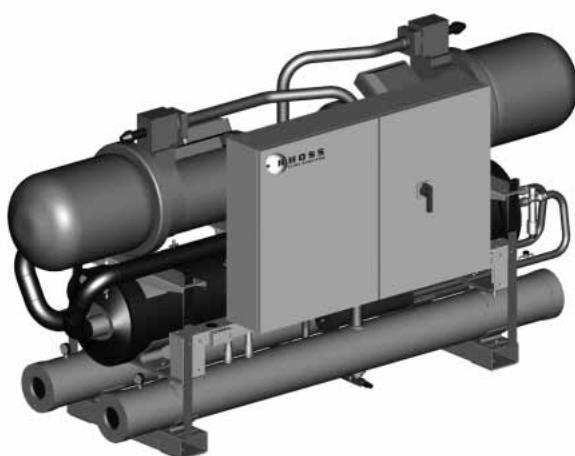

"SERIE" code

"MODEL" code

T	C	H	V	B	Z	1-2-3	201÷1631
Water chiller or heat pump	Cooling only	Water cooled	Semi-hermetic screw compressors	Standard version I Soundproofed version	R134a refrigerant charge	No. of compressors	Approximate cooling capacity (kW)

Example: TCHVBZ 2841 H.E.

- Water cooled water chiller;
- Standard operation;
- 2 semi-hermetic screw compressors;
- Approximately nominal cooling capacity 840 kW.

Structural features

- Compact load bearing structure made of galvanized steel sections and polyester powder-coated (WHITE RAL 9018).
- Semi-hermetic screw compressors with high energy efficiency, specifically designed to work with R134a gas. The compressor start-up is part-winding or star-triangle type with starting current limited by equalizer and load stepping, complete with integral protection and crankcase heater. The compressors are also complete with intercept valve on the refrigerant outlet pipe.
- The step capacity control therefore occurs as shown in the following table:

Model	Compressors/ Steps n.	Circuits n.
1201÷1601	1/3	1
2411÷21261	2/6	2
31301÷31631	3/9	3

- User side (evaporator) shell and tube dry expansion heat exchanger with counter-flow thermal exchange. It is made of carbon steel with inner rifled copper pipes, with water differential pressure switch, air bleed valve, water discharge cock, Victaulic type water connections and insulation of closed cell expanded polyurethane rubber with anti U.V. protection layer.
- Condenser shell of shell-and-tube type in carbon steel with copper pipes with integral finning, complete with high pressure safety valve and service connection with cock on refrigerant high pressure circuit. In the versions with heat pump set-up (inversion of water circuit), the condensers are lagged with insulation in closed cell expanded polyurethane rubber.
- 5" female threaded water connections.
- Refrigerant circuit is made with mild copper tubes and silver alloy welding or with A106 steel tubes, and is complete with: cartridge filter-drier, charge connections, manual reset high pressure switch, indicator of gas passage and any presence of humidity, electronic expansion valve, intercept valve on the liquid line, safety valve in the high pressure section, suction line insulation of closed cell expanded polyurethane rubber with anti U.V. protection layer.
- Refrigerant high and low pressure gauge for each refrigeration circuit.
- Refrigerant charge of eco-friendly R134a.

Electrical panel

- Electrical panel complying with IEC standards, water proof box complete with:
 - electrical wiring configured for power supply 400V-3ph-50Hz;
 - transformer for auxiliary circuit;
 - auxiliary power supply: 230V-1ph-50Hz;
 - control power supply: 24V-1ph-50Hz;
 - phase monitoring to protect the compressor;
 - power contactors;
 - remotable controls: remote ON/OFF, dual set point (DSP accessory), summer/winter selector (only in HPH version);
 - remotable machine controls: compressor(s) operation indicator light, general lockout indicator light;
 - general isolator with door interlock on the power supply;
 - automatic protection switch on auxiliary power circuit;
 - overload fuses for each compressor (the version with magneto-thermal switches for the protection of each compressor is optional);
 - fuses for auxiliary circuit.
- Programmable microprocessor or electronic control board, managed by keyboard inserted in machine, remotable up to 1,000 m. This electronic board performs the following functions:
 - For the standard unit, adjustment and control are made on evaporator inlet temperature (with the optional accessory CCL - stepless capacity control - chiller are managed through the evaporator outlet water temperature);
 - management of the safety delays; hour run meter of each compressor; automatic inversion of compressor operation sequence; circulation or user service pump (on both the evaporator and condenser side); electronic anti-freeze protection; of the load steps, of functions that integrate the workings of individual devices fitted to the unit;
 - management of the electronic expansion valve (EEV) with possibility to read and display suction temperature, evaporation pressure, overheating and valve opening status.
 - LCD display of programmed set points, of inlet/outlet water temperatures, of the condensing pressures, of alarms;
 - Multilanguage management (Italian, English, French, German, Spanish) of display information.
- Alarm history management. The following is memorized for each alarm (only if the KSC accessory is present):
 - date and time of activation;
 - alarm code and description;
 - the water inlet/outlet temperature values when the alarm intervened;
 - condensation pressure values at the time of the alarm;
 - alarm delay time from the switch-on of the connected device;
 - compressor status when the alarm intervened.
- Self-diagnosis with continuous monitoring of the machine's operational status.
- Advanced functions:
 - configured for serial connection via RS 485 port for communication with building automation, centralised systems and supervision networks.
 - management of time bands and operation parameters with the possibility of daily/weekly programming;
 - check up and verification of programmed maintenance status;
 - computer-aided testing of the units.

Versions

- B**- High energy efficiency standard version (TCHVBZ).
I- High energy efficiency soundproofed version, with soundproof jackets on compressors (TCHVIZ).

Factory-fitted accessories

DS - Desuperheater.

RC100 - 100% recovery with condensation heat recuperator.

TRD - Thermostat with display to show the water temperature at the recuperator/desuperheater inlet with the possibility of programming the activation set-point of a possible remote regulation device.

HPH - version for operation as a heat pump by means of inversion of the cycle on the water circuit. The version provides the possibility of displaying the condenser inlet and outlet water temperature and of setting and displaying the set point and temperature differential of the condenser inlet hot water. The condensers are covered with insulation in closed cell expanded polyurethane rubber.

CR - Power factor correction capacitors ($\cos\phi > 0,94$).

IM - thermal overloads switches for the protection of the compressors.

FDL - Forced Download Compressors, partialisation or compressors switch-off to limit the absorbed current and power (Digital Input).

CCL - stepless compressor capacity control (for example, for a two compressors unit, the capacity control is from 25% to 100%).

RR - Units with intercept valve on the compressor inlet (valve comes as standard on outlet). Not available on models 1531-1611-21031-21111-21181-21261-31351-31401-31461-31521-31591-31631.

SLO - oil level sensor (this accessory is suggested in condenserless units, when it is difficult to visual check the pilot lamp of the compressor or when a more detailed monitoring is requested).

SPS - refrigerant pressure signal on high and low side, on card.

CMT - control of power supply voltage MIN/MAX values.

RA - Evaporator antifreezing electrical heater with switch.

DSP - double set point.

CS - set point setting (4-20 mA).

BSP - 0-10 V signal for management of external condensation control systems, with variable-speed pump or water flow rate control valves.

SS - RS 485 serial interface for communicating with building management systems, centralised control systems and supervision networks (proprietary protocol, Modbus RTU).

FTT10 - LON serial interface - Serial interface for connection to BMS with protocol LON standard FTT10.

Accessori forniti separatamente

KSC - Scheda clock per visualizzare data/ora, per la gestione della macchina con fasci orarie giornaliere e settimanali e settimanali di start/stop, con possibilità di variarne il set-point.

KSA - Supporti anti vibranti in gomma.

KSAM - Supporti anti vibranti a molla.

KTR - Tastiera remota per comando a distanza, con funzionalità identiche a quella inserita in macchina.

Electronci controls

Electronic controller

The keyboard with display makes it possible to view the working temperature and all the unit process variables, as well as providing access to setting parameters for the operating set points and their modification. For purposes of technical assistance, it allows password-protected access to the unit's management parameters (access for authorised personnel only).

DISPLAY:

displays the numbers and the values of all the parameters (i.e. outlet water temperature etc.), any alarm codes and resource status by means of strings.

ALARM key:

makes it possible to display the code and reset any alarms.

PROGRAM key:

makes it possible to programme the machine's fundamental functioning parameters.

ESC key:

makes it possible to switch the unit on and off.

UP key:

used to scroll through the list of parameters, statuses and any alarms; makes it possible to modify set points.

ENTER key:

allows confirmation of the selected parameters.

DOWN key:

used to scroll through the list of parameters, statuses and any alarms; makes it possible to modify set points.

KTR – Remote keyboard

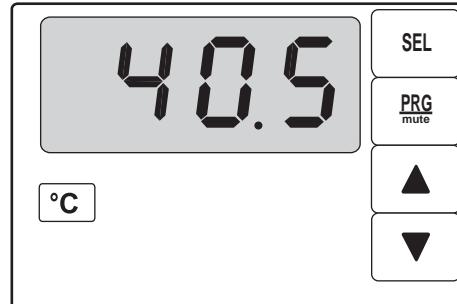

The remote keyboard with display (KTR) allows the remote control and display of all of the unit's digital and analogue process variables. It is therefore possible to control all the machine functions directly in the room. It allows setting and management of time periods.

The temporary presence of two devices, on-board machine keyboard and remote keyboard, will cause the on-board machine terminal to be disabled.

Clock card

Fitting the clock card (KSC) ensures more flexible and efficient operation of the unit, displaying the date/time and allowing the unit to be managed with daily and weekly time bands for switching the unit on/off and changing the set point.

TRD – Thermostat with display

The introduction in machine of the thermostat accessory with display (TRD) allows displaying of the inlet water temperature at the recovery unit/desuperheater and setting the activation set-point of an external regulation device (e.g. ON/OFF 3-way valve), allowing a rational and efficient use of the recovered thermal energy.

DISPLAY:

displays the recovery unit/desuperheater inlet water temperature value.

SEL key:

allows setting the activation Set-point and differential of any external adjustment device.

PRG/mute key:

allows access to the parameters programming menu.

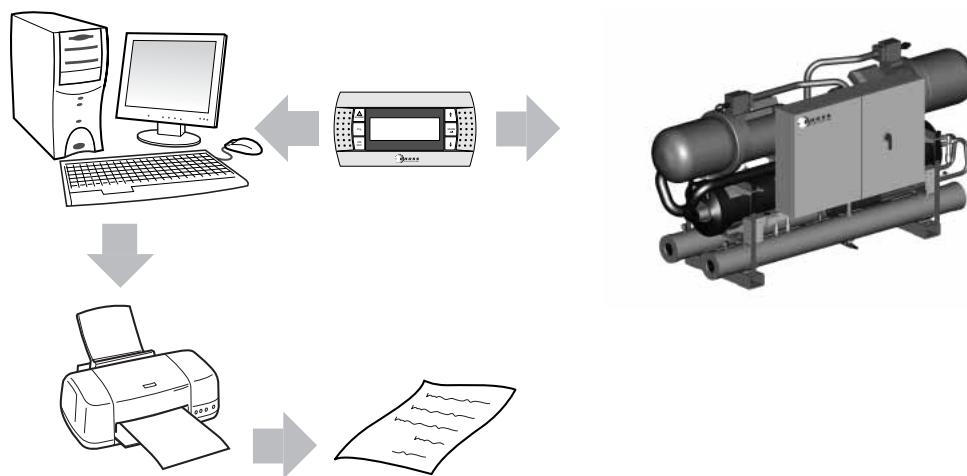

UP key:

allows scrolling the menu and modify the parameters.

DOWN key:

allows scrolling the menu and modify the parameters.

Serial Connection**Serial Connection**

Alternatively, the electronic control, with which all units are supplied, can communicate with an external system through a serial communication line.

Supervision

In general, a supervision system allows access to all unit functions, such as:

- Making all settings which are accessible through the keyboard;
- Reading all process variables of the inputs and outputs, whether digital or analogue;
- Reading the various alarm codes which are present, and resetting them as necessary;
- reading all programming parameters and varying some of them.

Note

For further information, contact the RHOSS after-sales support service.

Performance

Choice of machine and use of the performance tables

- Tables **B** provides, for each TCHVBZ-TCHVIZ model, the cooling capacity (QF), the total absorbed current (P) and the rejected heating capacity(QT), based on the cooling tower water at the condenser and evaporator outlet with temperature differentials $\Delta T = 5^\circ\text{C}$: in the case of models TCHVBZ-TCHVIZ with HPH accessory(heat pump set-up with inversion of water circuit) the value QT is the value of the heating capacity available to the user.
- Within the operating limits (see page 32), the values in tables **B** may allow interpolations of performance, whereas extrapolations are not permitted.
- Tables **C** and **D** include the performance corrective coefficients, upon variation of the temperature differential ΔT between the water inlet and outlet of the exchangers.
- The graph "**table M**" shows the pressure drop curves of the evaporator for models TCHVBZ-TCHVIZ.
- The graph "**table N**" shows the pressure drop curves of the condensers for models TCHVBZ-TCHVIZ.
- Table **O** shows the corrective coefficient values to be applied if water with glycol added is used.
- Table **P** contains the sound pressure levels in dB by octave bands and the total sound power in dB(A) for standard machines (TCHVBZ).
- Table **Q** contains the sound pressure levels in dB by octave bands and the levels of sound pressure and total sound power in dB(A) for soundproofed machines (TCHVIZ).

Example:

- Design conditions for a water-cooled chiller:
- Cooling capacity required = 410 kW;
- Water temperature produced at the evaporator = 7°C ;
- Temperature differential ΔT at the evaporator = 5°C ;
- Inlet temperature at the condenser = 30°C .

Using the values indicated in table "**A**", and supposing a temperature differential $\Delta T = 5^\circ\text{C}$ at the condenser, it is observed that the model TCHVBZ 1421 meets the requirement with:
 $QF = 418,0 \text{ kW}$; $P = 82,8 \text{ kW}$
 $QT = 498 \text{ kW}$.

The water flow G to be sent to the exchangers is obtained by using the following formulae:

$$G (\text{m}^3/\text{h}) \text{ evaporator} = (QF \times 0,86) \div \Delta T = (405,0 \times 0,86) \div 5 = 69,7 (\text{m}^3/\text{h})$$

$$G (\text{m}^3/\text{h}) \text{ condenser} = (QT \times 0,86) \div \Delta T = (472,0 \times 0,86) \div 5 = 81,2 (\text{m}^3/\text{h})$$

From the technical features table it is possible to obtain the pressure drops values Δp_w of the evaporator and condenser respectively for the nominal values:

$$\Delta p_w \text{ evaporator} = 49 \text{ kPa};$$

$$\Delta p_w \text{ condenser} = 31 \text{ kPa};$$

To reduce the flow of water to be sent to the condenser, it is necessary to increase the temperature differential ΔT . Supposing then to work with a ΔT at the condenser of 8°C .

With a temperature of the condenser inlet water $T_{in} = 30^\circ\text{C}$ the new condenser outlet water temperature will be:

$$\text{Condenser outlet temperature} = 30^\circ\text{C} + 8^\circ\text{C} = 38^\circ\text{C}.$$

○ Using the corrective coefficients $kct QF$ and $kct P$ in table C the new values for QFI , PI and hence QTI are calculated:

$$QFI = QF \times kct QF = 418,0 \times 0,97 = 405,5 \text{ kW}$$

$$PI = P \times kct P = 82,8 \times 0,96 = 79,5 \text{ kW}$$

$$QTI = (QFI + PI) \times 0,97 = (405,5 + 79,5) \times 0,97 = 482,6 \text{ kW}$$

The new water flows G to be sent to the exchangers are obtained from the following formulae:

$$G (\text{m}^3/\text{h}) \text{ evaporator} = (405,5 \times 0,86) \div 5 = 69,7 (\text{m}^3/\text{h})$$

$$G (\text{m}^3/\text{h}) \text{ condenser} = (482,6 \times 0,86) \div 8 = 51,9 (\text{m}^3/\text{h})$$

From the graphs "**table M**" e "**table N**" it is possible to extrapolate the values of the pressure drops Δp_w at the evaporator and at the condenser based on the new flows.

Otherwise the following simplified formulae can be used:

$$\Delta p_w' \text{ evaporator} = \Delta p_w \times (G_{old} \div G')^2 = 49 \times (69,7 \div 71,9)^2 = 43,7 \text{ kPa};$$

$$\Delta p_w' \text{ condenser} = \Delta p_w \times (G_{old} \div G')^2 = 31 \times (51,9 \div 85,6)^2 = 11,4 \text{ kPa}$$

Tuc = Condenser outlet water temperature (inlet/outlet $\Delta T = 5^\circ\text{C}$)Tue = Evaporator outlet water temperature (inlet/outlet $\Delta T = 5^\circ\text{C}$)QF = Cooling capacity with a fouling factor of $0,35 \times 10^4 \text{ m}^2 \text{ K/W}$ QT = Heating capacity with a fouling factor of $0,35 \times 10^4 \text{ m}^2 \text{ K/W}$

P = Total electrical power absorbed.

Table "B": performance data TCHVBZ – TCHVIZ 2411÷2711 H.E.

ATTENTION!

At the evaporator and at the condenser, the temperature differential ΔT between the inlet water and the outlet water must be between 3°C and 8°C.

Nominal operating conditions

Inlet/outlet evaporator water 12°C / 7°C,
inlet/outlet condenser water 30°C / 35°C.

Table "C": corrective coefficients ΔT

condenser water

For ΔT of the condenser water different from 5°C (ΔT minimum of 3°C and ΔT maximum of 8°C), for a given inlet water temperature (respectively 25°C, 30°C, 35°C, 40°C and 45°C), apply the following corrective coefficients to the data in tables:

ΔT	Kct QF	Kct P
3°C	1,01	0,99
5°C	1	1
8°C	0,97	0,96

Table "D": corrective coefficients ΔT

evaporator water

For temperature differentials ΔT of the evaporator water different from 5°C, for a given outlet water temperature (respectively 5°C, 7°C, 8°C, 9°C, 10°C, 13°C and 15°C), apply the following corrective coefficients to the data in tables:

ΔT	Kct QF	Kct P

Tuc = Condenser outlet water temperature (inlet/outlet $\Delta T = 5^\circ\text{C}$)

Tue = Evaporator outlet water temperature (inlet/outlet $\Delta T = 5^\circ\text{C}$)

QF = Cooling capacity with a fouling factor of $0,35 \times 10^4 \text{ m}^2 \text{ K/W}$

QT = Heating capacity with a fouling factor of $0,35 \times 10^4 \text{ m}^2 \text{ K/W}$

P = Total electrical power absorbed.

ATTENTION!

At the evaporator and at the condenser, the temperature differential ΔT between the inlet water and the outlet water must be between 3°C and 8°C.

Nominal operating conditions

Inlet/outlet evaporator water 12°C / 7°C,
inlet/outlet condenser water 30°C / 35°C.

Table "C": corrective coefficients ΔT **condenser water**

For ΔT of the condenser water different from 5°C (ΔT minimum of 3°C and ΔT maximum of 8°C), for a given inlet water temperature (respectively 25°C, 30°C, 35°C, 40°C and 45°C), apply the following corrective coefficients to the data in tables:

ΔT	Kct QF	Kct P
3°C	1,01	0,99
5°C	1	1
8°C	0,97	0,96

Table "D": corrective coefficients ΔT **evaporator water**

For temperature differentials ΔT of the evaporator water different from 5°C, for a given outlet water temperature (respectively 5°C, 7°C, 8°C, 9°C, 10°C, 13°C and 15°C), apply the following corrective coefficients to the data in tables:

ΔT	Kct QF	Kct P
3°C	0,99	0,99
5°C	1	1
8°C	1,01	1,01

Functioning limits:**RC100:**

- temperature of hot water produced 25÷45°C with permitted water temperature differential 4÷6°C;
- the minimum permitted inlet water temperature is 20°C.

DS:

- temperature of hot water produced 35÷45°C with permitted water temperature differential 5÷10°C;
- the minimum permitted inlet water temperature is 25°C.

- NOTA:** It is possible to increase the desuperheater water temperature by increasing the condenser inlet/outlet water temperature, with a reduction of the unit's efficiency.

Performance refer to the unit with chilled water temperature 7°C, with evaporator temperature differential 5°C.

Performance of DS is referred to inlet/outlet condenser water temperature 30°C / 35°C.

(*) Heating capacity with recuperator and desuperheater fouling factor of $0,35 \times 10^{-4} \text{ m}^2 \text{ K/W}$.

Attention

The units equipped with recovery unit permanently placed in series to compressor must be started in conformity with the dispositions of Ministerial Decree 1/12/2004 n. 309.

This law is only valid in Italy. For installation in other countries, please abide by the local laws in force.

Functioning limits:**RC100:**

- temperature of hot water produced 25÷45°C with permitted water temperature differential 4÷6°C;
- the minimum permitted inlet water temperature is 20°C.

DS:

- temperature of hot water produced 35÷45°C with permitted water temperature differential 5÷10°C;
- the minimum permitted inlet water temperature is 25°C.

- NOTA:** It is possible to increase the desuperheater water temperature by increasing the condenser inlet/outlet water temperature, with a reduction of the unit's efficiency.

Performance refer to the unit with chilled water temperature 7°C, with evaporator temperature differential 5°C.

Performance of DS is referred to inlet/outlet condenser water temperature 30°C / 35°C.

(*) Heating capacity with recuperator and desuperheater fouling factor of $0,35 \times 10^{-4}$ m² K/W.

Attention

The units equipped with recovery unit permanently placed in series to compressor must be started in conformity with the dispositions of Ministerial Decree 1/12/2004 n. 309.

This law is only valid in Italy. For installation in other countries, please abide by the local laws in force.

Energy efficiency at partial loads - ESEER and IPLV indexes

- The E.E.R. index represents an estimate of the energy efficiency of the cooling unit in nominal design conditions. In reality, the operating time of a chiller in nominal conditions is usually less than the operating time in partial load conditions.
- The IPLV (Integrated Part Load Value) and ESEER indexes (European Seasonal EER) are those that estimate the average seasonal energy efficiency of the cooling unit on four load and outdoor air temperature conditions. In general, two chillers that have the same EER value can have different IPLV or ESEER values. In fact, for an air-cooled cooling unit, the average energy efficiency depends on the design choices and the temperature of the air entering the condensing coil.
- The IPLV and ESEER indexes, introduced respectively by the ARI (American Refrigeration Institute - ARI standard 550/590) and the European Community (EECCAC Energy Efficiency and Certification of Central Air Conditioners project), have the same formulation, but differ due to outdoor air temperatures (see table "E") and for the energy weights that are assigned to the four load conditions considered for the calculation: 100%, 75%, 50% and 25% and for Tw produced (6.7°C IPLV / 7°C ESEER).

$$\begin{aligned} \text{IPLV} &= \frac{1 * \text{EER}_{100\%} + 42 * \text{EER}_{75\%} + 45 * \text{EER}_{50\%} + 12 * \text{EER}_{25\%}}{100} \\ \text{ESEER} &= \frac{3 * \text{EER}_{100\%} + 33 * \text{EER}_{75\%} + 41 * \text{EER}_{50\%} + 23 * \text{EER}_{25\%}}{100} \end{aligned}$$

where $\text{EER}_{100\%}$, $\text{EER}_{75\%}$, $\text{EER}_{50\%}$, $\text{EER}_{25\%}$ represent the efficiencies of the cooling unit in the four load conditions and at the temperatures indicated in table "E".

Table "E": load and temperatures conditions

Load	Outdoor air temperature	
	IPLV	ESEER
100%	29,4°C	30°C
75%	23,9°C	26°C
50%	18,3°C	22°C
25%	18,3°C	18°C

- Table "F" shows the E.E.R. and ESEER values for each model. The high values of energy efficiency at partial loads were achieved thanks to optimisation of the heat exchangers.

Table "G" shows the cooling capacity (%) and the total absorbed power (%) for each model, in correspondence of each supplied cooling capacity step.

Table "G"

Steps (*)	Models			
	1201÷1611	2411÷21261	31301÷31631

Loss of evaporator load

Calculation of Pressure Drops

- The water flow rate at the exchanger is calculated according to the following formula:

$$G = (Q \times 0,86) : \Delta T$$

- Where:

G (m^3/h) = water flow rate at the exchanger;

Q (kW) = heat exchanged, which may be Q_F (for the evaporator) or Q_T (for the condenser), depending on the exchanger considered;
 ΔT ($^\circ\text{C}$) = temperature differential;

- The pressure drops can be found in the graphs "table M", "table N" or calculated with the following formulae:

$$\Delta p_w = \Delta p_{w,\text{nom}} \times (G : G_{\text{nom}})^2$$

- where:

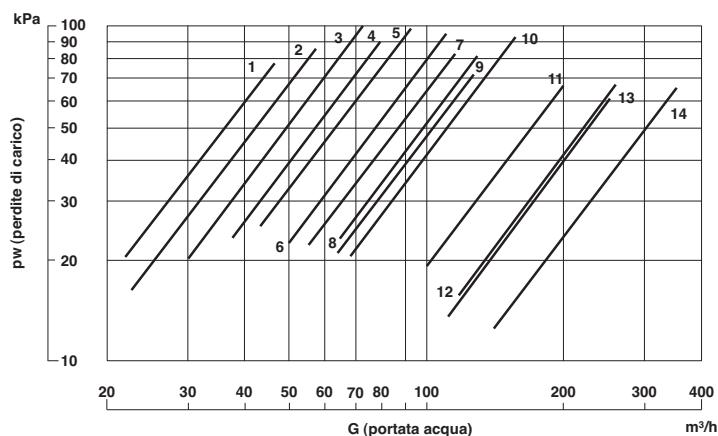

Δp_w (kPa) = pressure drop at the exchanger in consideration;

$\Delta p_{w,\text{nom}}$ (kPa) = nominal pressure drop at the exchanger in consideration ("technical features" table);

G (kW) = water flow at the exchanger in consideration;

G_{nom} (kW) = water flow at the exchanger in consideration ("technical features" table).

Table "M": evaporator pressure drops TCHVBZ-TCHVIZ 1201÷31631 H.E.

- 16 = model 31461-31521-31591
- 17 = model 31631

N.B.:

For all machines, in any case refer to the operating limits shown on page 32 and the admissible temperature differentials ΔT .

Functioning limits

T (°C) = evaporator outlet temperature

t (°C) = condenser outlet temperature

Standard operation.

- The graph of the operating limits is valid for temperature differentials ΔT at the evaporator and at the condenser equal to 5°C.

- Units can also be provided on request to supply chilled water at less than 5°C.

Temperature differentials permitted through the exchangers:

- Temperature differential at evaporator $\Delta T = 3 \div 8^\circ\text{C}$.
- Temperature differential at condenser $\Delta T = 3 \div 8^\circ\text{C}$.
- Consider the minimum and maximum water flow indicated in the tables. For water flows out of the ranges shown, please call the RHOSS S.P.A. presale service.

ATTENTION!

The machines have been conceived and designed exclusively for indoor installation.

If outdoor installation is required, it will necessitate modifications which must be evaluated by our technical office.

Use of antifreeze solutions

- The use of ethylene glycol is recommended if you do not wish to drain the water from the hydraulic system during the winter stoppage, or if the unit has to supply chilled water at temperatures lower than 5°C. The addition of glycol changes the physical properties of the water and consequently the performance of the unit. The proper percentage of glycol to be added to the system can be obtained from the most demanding functioning conditions from those shown below.

Protection from freezing for seasonal stoppage

- Table "O" shows the multipliers which allow the changes in performance of the units to be determined in proportion to the required percentage of ethylene glycol.
- The multipliers refer to the following conditions: condenser inlet air temperature 30°C; chilled water temperature 7°C; temperature differential at evaporator 5°C.

Lw Total sound power level in dB(A) on the basis of the measurements made in compliance with the UNI EN-ISO 9614.

Lp Sound pressure in a open field on reflecting plane; value at a distance of 1 meter from the unit side and at a height of 1 meter from the support plane.

Table "Q": Sound power levels in dB by octave band, total sound power level in dB(A) and the sound pressure levels in dB(A) at different distances.

(*) If the KSA anti-vibration accessory will be used, the dimension "c" should be expected to increase by about MAX 180 mm.

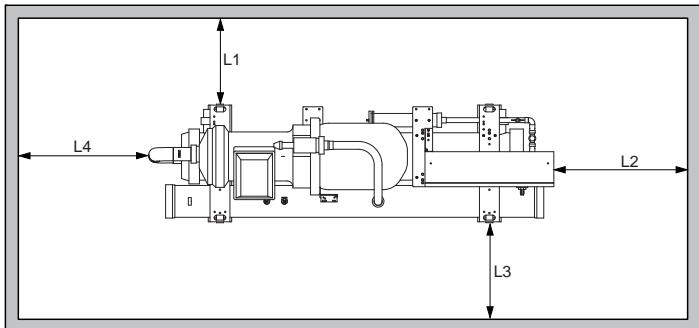

If the KSAM anti-vibration accessory will be used, the dimension "c" should be expected to increase by about MAX 160 mm.

For further information contact RHOSS sales support service.

N.B.

The input for the electrical connection is located in the lower right part of the electrical panel.

Clearance distances

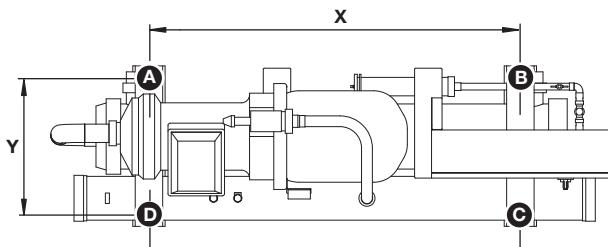

Installation

- The unit should be placed in accordance with the minimum technical service distances advised in figure, to allow access to the water and electrical connections, as well as access for maintenance of the exchangers.
- The unit may be equipped with anti-vibration supports, available on request (KSA-KSAM).

(*) If the KSA anti-vibration accessory will be used, the dimension "c" should be expected to increase by about MAX 180 mm.
If the KSAM anti-vibration accessory will be used, the dimension "c" should be expected to increase by about MAX 160 mm
For further information contact RHOSS sales support service.

N.B.

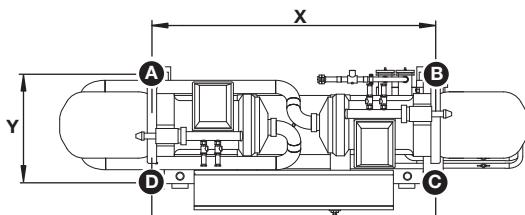

The input for the electrical connection is located in the lower right part of the electrical panel.

Clearance distances

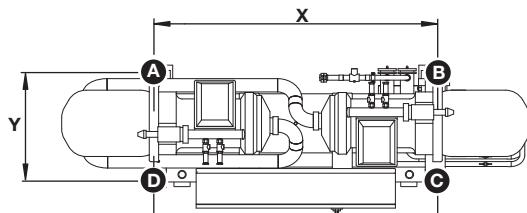

Installation

- The unit should be placed in accordance with the minimum technical service distances advised in figure, to allow access to the water and electrical connections, as well as access for maintenance of the exchangers.
- The unit may be equipped with anti-vibration supports, available on request (KSA-KSAM).

Electrical connections

TCHVBZ-TCHVIZ 1201÷1611 H.E.

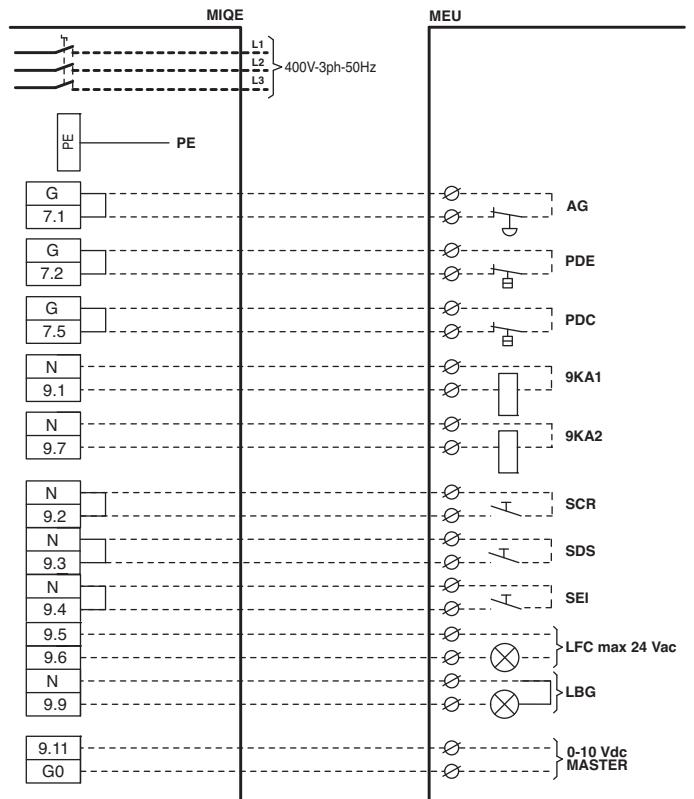

MIQE	Internal electrical panel terminal board
MEU	External user terminal board
AG	General alarm
KA1	Evaporator pump contactor control (Live contact)
KA2	Condenser pump contactor control (only TCHVBZ-TCHVIZ) (Live contact)
LBG	Machine general lock light (consens us in voltage 230 Vac).
LFC	Compressor operation indicator light (Clean contact)
L	Line
PDC	Condenser differential pressure switch
PDE	Evaporator differential pressure switch
PE	Earth connection
SCR	Remote control selector (Control with clean contact)
SDS	Dual set point selector (Control with clean contact)
SEI	Summer/winter selector (Clean contact)
---	Connection by installer

- The access to the electrical board (IP20) is possible through the front panel of the unit.
- The connections must be carried out in accordance with current standards and with the electrical wiring diagram included.
- Earthing is compulsory by law.
- Always install the unit in a protected area, and near the machine place an automatic main switch, or fuses, of suitable capacity and interruption power.

ATTENTION!

The following diagrams only show the connections to be made by the installer.

For electrical connections to the unit and the accessories, follow the wiring diagrams which are supplied with them.
